

HW4

For the first question, the issue I encountered was that I couldn't import the package "aiger" at the beginning. After conducting some research, I discovered that this package should be used with Python 3, whereas we typically work in a Python 2.7 environment for other assignments. To resolve this, I installed pip under the Python 3 environment. Then, after installing "aiger," I was able to successfully import it and create "h4p1.cnf" using Python 3. I suggest providing a tutorial on how to use this module, since most students are not familiar with it, and we typically use Python 2.7 in this class. This tutorial would be beneficial for guiding students on how to install and utilize the package effectively.
